

LC7538JM

**Electronic Volume Control System
for Car Audio**

Overview

The LC7538JM is a fully equipped electronic volume IC which permits significant reductions in externally connected components while providing ample volume, balance, loudness, fader, bass and treble control functions.

Features

- **Volume** : 81 positions ranging from 0 dB to -79 dB (in 1 dB increments) plus -∞. Separate left and right control provides excellent balance function.
- **Loudness** : Loudness operation provided by externally attached CR to activate tap at the -20 dB position of the volume ladder resistor.
- **Fader** : Fader function traversing 16 positions with rear or front attenuated output only (these 16 positions consist of 2 dB step intervals ranging from 0 dB to -20 dB, 5 dB step intervals ranging from -20 dB to -45 dB, plus the end settings of -60 dB and -∞).
- **Bass and Treble**: Using externally attached C (capacitor), the LC7538JM provides bass-treble mutual 15-position control and formats a NF-form tone control circuit (LUX form).
- On-chip op amplifier for caching applications reduces external components.
- Reduced switching noise with silicon gate CMOS processor.
- All controls performed using serial data input (C²B).

Loudness Characteristics

Loudness External Constant Calculation Sample

First, refer to page 7 where the 5 dB step internal equivalent circuit for the LC7538JM is shown. Using this information, an external constant for loudness can be added to establish a simplified circuit for computation as shown in Figure 1. Computations gaining a 5 dB boost with $f = 100$ Hz using this configuration are shown in the following. ($f = 100$ Hz and 5 dB boost)

Within figure 1, when R and C are defined as:

$$R1 = R2 = 10 \text{ k}\Omega$$

$$R3 = 1 \text{ k}\Omega$$

$C1 = Z1, C2 = Z2$, then the following equation can be established:

$$V_{OUT} = \frac{\frac{R2(R3 + Z2)}{R2 + R3 + Z2}}{\frac{R1 \cdot Z1}{R1 + Z1} + \frac{R2(R3 + Z2)}{R2 + R3 + Z2}} = -20\text{dB}$$

(at = 1kHz)

$$V_{OUT} = \frac{\frac{R2(R3 + 10 \cdot Z2)}{R2 + R3 + 10 \cdot Z2}}{\frac{R1 \cdot 10 \cdot Z1}{R1 + 10 \cdot Z1} + \frac{R2(R3 + 10 \cdot Z2)}{R2 + R3 + 10 \cdot Z2}} = -15\text{dB}$$

(at = 100Hz)

thereby resulting in,

$$Z1 \approx 178.3 \text{ k}\Omega \text{ and } Z2 = 176 \Omega.$$

Under such conditions where $f = 1$ kHz, specifications may be satisfied if C (capacitor) having these impedances is supplied externally. The end result is that $C1 = 893$ pF and $C2 = 0.9$ μ F.

- R1, R2 and R3 : LC7538JM on-chip resistors
- C1 : External high-band compensation capacitor
- C2 : External low-band compensation capacitor

Figure 1

A01034

Notes for Above Applications

- When the power supply is turned on, the internal analog switch becomes inexact. Until data is set, counter measures such as those required for muting are performed externally.
- In order to prevent crossover into the analog system of high-frequency digital signals transferred to the CL, DI and CE pins, transfer along these signal lines should occur along shielded lines, or the signal lines should be protected by using the grounding pattern or the circuit.
- For volume steps with large attenuation levels (over -20 dB), when the loudness circuit is off the high frequency region (above about 4 kHz) will be attenuated by about 3 dB relative to the low frequency region (about 400 Hz) due to the influence of the resistance of the loudness circuit analog switch. Therefore we recommend using tone control compensation together with the volume step described above.
- When sending data immediately after power on, send data as follows:
 - When sending independent left and right data, send data at least four times.

$\overline{\text{Lch data}} \overline{\text{Rch data}} \overline{\text{Lch data}} \overline{\text{Rch data}} \dots$

- Alternatively, when sending data that drives the left and right channels at the same time, send the data at least twice.

$\overline{\text{L/R data}} \overline{\text{L/R data}} \dots$
